PCWA UPDATE

Placer County Water Agency

VOLUME 16 • NUMBER 2 • APRIL-MAY, 2002

On Tap: Good Water

PCWA Water Meets, Exceeds Public Health Standards

The Board of Directors and staff of the Placer County Water Agency are proud to report once again, as we have each year since 1991, that the drinking water supplied to you meets or exceeds state and federal public health standards for quality and safety.

California water retailers are required by law to inform customers about the quality of their drinking water.

State, Federal Agencies Regulate Water Quality

Water quality is regulated by the federal government through the Safe Drinking Water Act of 1974. Uniform standards for this regulation are established by the Environmental Protection Agency (USEPA). In California, these standards are enforced by the State Department of Health Services.

Lab Test

PCWA Water Plant Operator Dan Mihalov conducts a jar test in the water agency's laboratory at the Foothill Water Treatment Plant in Newcastle.

This PCWA Water Quality Report, also known as a Consumer Confidence Report, has been prepared under guidelines from the USEPA and the California Department of Health Services.

Please turn to pages 2, 3 and 4 for this year's Water Quality Report.

Additional Test Results Are Also Included

To better inform its customers, PCWA has gone beyond the mandatory reporting requirements and also has included additional test results. These non-mandated test results are also reported.

Lahontan Groundwater

Data Collected in 2001, Reported in 2002

California MCLs and PHGs, Federal MCLGs

The Source of Your Water Supply

The Lahontan Water System is served by groundwater from two wells. Water is piped to customers in the service area.

Measurements reported here were collected in 2001 (unless noted). In accordance with federal regulations, data is from the most recent tests taken. We are allowed to monitor for some contaminants less than once per year because concentrations of these contaminants do not change frequently.

Parameters/ Constituents	Units	State MCL	MCLG or (PHG)	PCWA Levels Range (Avg.)	Year Monitored	Likely Source of Contamination
Inorganic Primary Drinking Water Standards						
Copper (at the tap, 90th percentile)	ppm	AL=1.3	(0.17)	0.2	2001	Internal corrosion of household plumbing
Arsenic	ppb	50	None	ND-3.1 (2.0)	2001	Erosion, natural deposits
Chromium	ppb	50	100	1.1-1.6 (1.4)	2001	Erosion, natural deposits
Vanadium	ppb	AL=50	None	ND-5 (2.5)	2001	Erosion, natural deposits

Radiological Primary Drinking Water Standards

Alpha Activity, Gross	pCi/L	15	0	2.5	1999	Erosion of natural deposits
--------------------------	-------	----	---	-----	------	--------------------------------

Secondary Drinking Water Standards

Total Dissolved Solids (TDS)	ppm	1000	None	120	2001	Naturally present in environment
Specific Conductance	umho/cm	1600	None	180	2001	Naturally present in environment
Chloride	ppm	500	None	1.2	2001	Naturally present in environment
Sulfate	ppm	500	None	0.59	2001	Naturally present in environment
Total Hardness	ppm	No Standard	None	82	2001	Naturally present in environment
Sodium	ppm	No Standard	None	7.7	2001	Naturally present in environment

Non-Mandated Water Quality Information of Interest

Radiological

Radon 222*	pCi/L	None	None	930-1600 (1198)	2001
------------	-------	------	------	-----------------	------

**Radon is a radioactive gas that you can't see, smell or taste. It is found throughout the U.S. Radon can move up through the ground and into a home through cracks and holes in the foundation. Radon can build up to high levels in all types of homes. Radon can get into indoor air when released from tap water. Compared to Radon entering through soils, radon entering a home through tap water will in most cases be a small source in indoor air. Radon is a known human carcinogen. Breathing air containing Radon can lead to lung cancer and drinking water with Radon may increase risk of stomach cancer. If you are concerned about Radon, test the air in your home. Fix your home if the level is 4 picocuries per liter or higher. For information, call the USEPA Radon Hotline (1-800-SOS-RADON).*

** These Radon samples were taken at the Lahontan well head. The results of these samples may not reflect the actual levels of Radon in your drinking water. The levels of Radon may be lower. More Radon sampling will be done in the future.*

FOR MORE INFORMATION on water quality or questions about the results presented in this report, PCWA customers are invited to contact the PCWA Customer Service Center. Call (530) 823-4850 or toll-free 1-800-464-0030.

About Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. Environmental Protection Agency's Safe Drinking Water Hotline (1-800-426-4791).

Note to At-Risk Water Users

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Environmental Influences on Water

The sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salt and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- Pesticides or herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff and septic systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

Ensuring Safety

In order to ensure that tap water is safe to drink, USEPA and the state Department of Health Services prescribe regulations which limit the amount of certain contaminants in water provided by public water systems. State regulations also establish limits for contaminants in bottled water that must provide the same protection for public health.

Understanding Your Water Quality Report: Definitions

MCLG: Maximum Contaminant Level Goal. The level of a contaminant in drinking water below which there is no known or expected risk to health. Set by the U.S. Environmental Protection Agency.

MCL: Maximum Contaminant Level. The highest level of a contaminant that is allowed in drinking water. Primary MCL's are set as close to the PHG's (or MCLG's) as is economically and technologically feasible. Secondary MCL's are set to protect the odor, taste and appearance of drinking water.

PHG: Public Health Goal. The level of a contaminant in drinking water below which there is no known or expected risk to health. PHG's are set by the California Environmental Protection Agency.

PDWS: Primary Drinking Water Standard. MCL's for contaminants that affect health along with their

monitoring and reporting requirements, and water treatment requirements.

NTU: Nephelometric Turbidity Units. A measure of the clarity of water.

TT: Treatment Technique. A required process intended to reduce the level of a contaminant in drinking water.

pCi/l: picocuries per liter. A measure of radiation.

ppm: parts per million, or milligrams per liter (mg/l)

ppb: parts per billion, or micrograms per liter (ug/l)

umho/cm: Micromhoes per centimeter. Measurement of water's ability to conduct electrical current.

<: Less Than

PCWA Supplies Safe Drinking Water

PCWA customers should feel comfortable in knowing their water is carefully treated and monitored by a team of licensed professional water treatment operators.

It is also important to note that our location near the mountain snowpack provides fresh runoff and reduces the chance for upstream contamination.

Snowpack runoff is the source for all PCWA customers except for a small number served by wells.

The agency's Water Quality Section is headquartered at the Auburn Water Treatment Plant in Auburn. Water testing and monitoring are conducted regularly in a laboratory at the Foothill Water Treatment Plant in Newcastle. The agency sends out to professional labs for complete water analyses.
